Descriptive Statistics: Age, AvgYearlySalary

Statistics

Variable	N	N *	Mean	SE Mean	StDev	Minimum	Q1	Median	Q3
Age	30	0	26.500	0.469	2.570	22.000	24.000	26.000	28.000
AvgYearly Salary	30	0	434938	875342	479444	545000	573750	225000	688125

Variable	Maximum
Age	32.000
AvgYearly Salary	1600000

Regression Analysis: AvgYearlySalary versus Age

The regression equation is

$$\text{AvgYearlySalary} = -22147948 + 999900 \text{ Age}$$

The intent of this study was to determine whether there was a relationship between the age of an MLB player and his salary (if older players make more because of their experience or if younger players make more because of their skill and energy). In attempt to find the answer to this question, I collected data on the salaries of the 30 starting shortstops in the league. I chose to only look at shortstops because position can often influence salary. Each team had one starting shortstop, so these were obtained using statistics from ESPN. By "starting shortstop" it is meant that the particular player started at shortstop for the majority of that team's season. A player's salary can also depend on how many years the contract is for, so I considered average yearly salary in my data collection (data on age coincides with the year for the salary).

The correlation coefficient for the data was 0.54, meaning there was a moderate linear correlation between the two variables. As age increased, so did the player's average yearly salary. After graphing the residuals versus fits, it can be concluded that the relationship is indeed linear and not anything else because the graph is entirely random. No pattern in the residual plot proves that the relationship is linear. Therefore,

there is a relationship between the age of an MLB player and his salary. This relationship, although it is not strong, is a positive one.
